In the Abstract:

Please amend the Abstract as follows:

An integrated circuit for a smart card ~~may include~~ in accordance with an exemplary embodiment includes at least one data terminal for providing communications with a host device and a processor for providing an attachment signal on the at least one data terminal for recognition by the host device. Further, the processor ~~may also cooperate~~ cooperates with the host device to perform an enumeration based upon at least one default descriptor. In addition, based upon a system event, the processor ~~may selectively remove~~ removes the attachment signal from the at least one data terminal and thereafter again ~~provide~~ provides the attachment signal on the at least one data terminal and ~~cooperate~~ cooperates with the host device to perform a new enumeration based upon at least one alternate descriptor.
